### Abstract:

We introduce the Theory of Non-Relativity: a framework in which everything is exactly as it seems, everywhere, always. No reference frames, no uncertainty – just vibes. This work challenges Einstein's relativity by proposing a model that is simpler, more confident, and completely unfalsifiable.

---

### 1. Introduction

Einstein's theory of relativity transformed physics with its emphasis on reference frames and the flexibility of space-time. This, however, is exhausting. We propose non-relativity: a bold new approach that assumes no variation, no distortion, and most importantly, no math.

---

### 2. Core Principles

#### → The Mock Theory:

"Everything is exactly as it seems, everywhere, always.  
No frames of reference. Just vibes."

#### → Philosophical Foundation:

"Non-relativity: the belief that all truths are fixed,  
context is irrelevant, and subjectivity is a scam."

#### → Scientific Innovation:

"Einstein had relativity. I have non-relativity.  
His equations bent space and time – mine ignore them completely."

---

### 3. Applications and Future Work

#### → Beyond the Theory of Everything:

"Why stop at a theory of everything?  
I'm working on a theory of nothing.  
Zero assumptions, zero predictions, infinite funding."

---

#### 4. Funding and Conflicts of Interest

This study was conducted with no funding, no oversight, and no regard for scientific consensus. All conflicts of interest have been embraced enthusiastically.

---

#### 5. Conclusion

Non-relativity offers a reality unburdened by complexity. It is absolute, intuitive, and always correct – especially when it isn't.
